**ABSTRACT:** Since the seminal works on the application of density functional theory and the computational hydrogen electrode to electrochemical CO<sub>2</sub> reduction (eCO<sub>2</sub>R) and hydrogen evolution (HER), the modeling of both reactions has quickly evolved for the last two decades. Formulation of thermodynamic and kinetic linear scaling relationships for key intermediates on crystalline materials have led to the definition of activity volcano plots, overpotential diagrams, and full exploitation of these theoretical outcomes at laboratory

## Absence of CO<sub>2</sub> electroreduction on copper, gold and silver electrodes without metal cations in solution

Mariana C. O. Monteiro<sup>ID</sup><sup>1</sup>, Federico Dattila<sup>ID</sup><sup>2</sup>, Bellenod Hagedoorn<sup>ID</sup><sup>1</sup>, Rodrigo García-Muelas<sup>ID</sup><sup>2</sup>, Núria López<sup>ID</sup><sup>2</sup> and Marc T. M. Koper<sup>ID</sup><sup>1</sup>✉

The electrocatalytic reduction of carbon dioxide is widely studied for the sustainable production of fuels and chemicals. Metal ions in the electrolyte influence the reaction performance, although their main role is under discussion. Here we studied CO<sub>2</sub> reduction on gold electrodes through cyclic voltammetry and showed that, without a metal cation, the reaction does not take place in a pure 1 mM H<sub>2</sub>SO<sub>4</sub> electrolyte. We further investigated the CO<sub>2</sub> reduction with and without metal cations in solution using scanning electrochemical microscopy in the surface-generation tip-collection mode with a platinum ultramicroelectrode as a CO and H<sub>2</sub> sensor. CO is only produced on gold, silver or copper if a metal cation is added to the electrolyte. Density functional theory simulations confirmed that partially desolvated metal cations stabilize the CO<sub>2</sub> intermediate via a short-range electrostatic interaction, which enables its reduction. Overall, our results redefine the reaction mechanism and provide definitive evidence that positively charged species from the electrolyte are key to stabilize the crucial reaction intermediate.
